Simulated data

Transcript of Conducted Interviews

The three stakeholder interviews in this document (INT-01 to INT-03) were **simulated for coursework**. The participants are fictional personas created by the project team, not real people. The interviewers are members of the project team.

This material shows the elicitation process used to derive the requirements in the *Inclusive Employment Platform* requirements engineering report. It does not represent the verified views of real stakeholders.

Transcript of Conducted Interviews

Accessible Job Search Platform Requirements Interview

Interview Overview

Interview ID	Stakeholder	Method	Purpose
INT-01	Job seeker with physical disability	Semi-structured interview	Workplace accessibility and employment barriers
INT-02	Job Seeker with Cognitive Disability	Semi-structured interview	Application flexibility and notifications
INT-03	Employer	Semi-structured interview	Inclusive recruitment, fair screening and employer verification

***** Participants are simulated personas created for coursework (see notice on the first page). Interview IDs are used to refer to each participant in the transcript. *****

Interview 1 Questions

Interview ID: INT-01

1. What challenges do you face when searching or applying for jobs?
2. What information do you need before deciding whether to apply?
3. What workplace-accessibility information should employers provide?
4. How should accessibility information be displayed?
5. What features would make applications easier to complete?
6. Should users be able to save incomplete applications?
7. What interview methods should be available?
8. Should users be able to request accommodations without disclosing a diagnosis?
9. What concerns do you have about disability disclosure?
10. How should jobs be recommended?
11. What would make you trust an employer?
12. How should disability-inclusive employer claims be verified?
13. What should happen when a job posting is misleading or discriminatory?
14. How should the platform support users with limited internet access?
15. How should disability-related information be protected?

Interview Transcript 1

Wan Jun: Thank you for participating in this interview. We are developing an inclusive job-search platform for persons with disabilities. Your participation is voluntary, and you are not required to provide medical information. Are you comfortable continuing?

Participant: Yes, I am comfortable continuing.

Jin Ming: What challenges do you face when searching or applying for jobs?

Participant: Many job advertisements do not explain whether the workplace is physically accessible. I may spend a lot of time completing an application before discovering that the office has stairs, narrow entrances or an unsuitable workspace. Travelling to an interview can also be difficult when the location is not accessible.

Tiong Sheng: What information do you need before deciding whether to apply?

Participant: I need to know the job responsibilities, working hours, location and whether remote or hybrid work is available. I also need accurate information about the workplace before deciding whether travelling there is possible.

Wan Jun: What workplace-accessibility information should employers provide?

Participant: Employers should state whether the workplace has ramps, lifts, accessible toilets, accessible parking and suitable public transportation. They should also mention whether the entrances, interview rooms and workspaces are wheelchair accessible.

Jin Ming: How should accessibility information be displayed?

Participant: A short accessibility summary should appear directly in the job advertisement. There could be symbols showing available facilities, but the symbols should also have text descriptions. Users should be able to open a section containing more detailed information.

Tiong Sheng: What features would make applications easier to complete?

Participant: The platform should have clear navigation, large buttons and simple forms. The application should be divided into clear sections so that users do not have to complete everything on one long page.

Wan Jun: Should users be able to save incomplete applications?

Participant: Yes. Users should be able to save their progress and continue later. They should also be able to reuse their résumé and supporting documents instead of uploading the same files for every application.

Jin Ming: What interview methods should be available?

Participant: Employers should provide face-to-face, telephone and video interviews when possible. A remote interview may be more manageable for someone who faces transportation or mobility barriers.

Tiong Sheng: Should users be able to request accommodations without disclosing a diagnosis?

Participant: Yes. Applicants should only need to explain the adjustment they require, such as an accessible interview room or a video interview. They should not have to provide detailed medical information.

Wan Jun: What concerns do you have about disability disclosure?

Participant: I would worry that an employer might reject me before considering my qualifications. I would also be concerned that the information could be shared with people who do not need access to it. Disclosure should always be optional.

Jin Ming: How should jobs be recommended?

Participant: Recommendations should mainly be based on skills, qualifications, preferred location and working arrangements. Workplace accessibility can be considered when the user

selects it as a preference. The platform should not assume that a person cannot perform a job because of a disability.

Tiong Sheng: What would make you trust an employer?

Participant: The employer should be verified before posting jobs. The advertisement should contain complete information, and the employer should regularly update its workplace-accessibility details.

Wan Jun: How should disability-inclusive employer claims be verified?

Participant: Employers should provide evidence of their facilities and accommodation policies. They should not receive an inclusive-employer badge simply by selecting a checkbox.

Jin Ming: What should happen when a job posting is misleading or discriminatory?

Participant: Users should be able to report the advertisement easily. The platform should review the report, remove harmful postings where necessary and provide human assistance for serious discrimination complaints.

Tiong Sheng: How should the platform support users with limited internet access?

Participant: It should work on lower-cost phones and unstable internet connections. It should not require large downloads, and application progress should be saved automatically.

Wan Jun: How should disability-related information be protected?

Participant: Only authorised people should be able to access it. Users should be told why the information is collected, who can view it and how to delete it. The information should not be shared with employers without permission.

Wan Jun: To summarise, your main needs include accurate workplace-accessibility information, draft saving, alternative interview methods, optional disclosure, skills-based recommendations, employer verification and secure data handling. Is that correct?

Participant: Yes, that correctly represents my needs.

Interview 2 Questions

Interview ID: INT-02

1. What challenges do you face when searching or applying for jobs?
2. How should job information be presented?
3. Would a plain-language or easy-read mode be useful?
4. What features would make applications easier to complete?
5. Should users be able to save and continue applications?
6. How should form errors be explained?
7. What notification controls should be provided?
8. What interview methods would make you more comfortable?
9. Should disability disclosure be optional?
10. Should accommodations require a medical diagnosis?
11. How should job recommendations be determined?
12. Should the platform explain why a job was recommended?
13. What access should caregivers or job coaches receive?
14. What should happen when users experience discrimination or scams?
15. How should sensitive personal information be protected?

Interview Transcript 2

Wan Jun: Thank you for participating. We are developing an accessible job-search platform for persons with disabilities. You are not required to provide medical information, and you may stop the interview at any time. Are you comfortable continuing?

Participant: Yes, I am comfortable continuing.

Jin Ming: What challenges do you face when searching or applying for jobs?

Participant: Long job descriptions and application forms can be difficult to understand. Sometimes too many instructions appear on one page, and I am unsure which section I should complete first. I may also need more time to finish an application.

Tiong Sheng: How should job information be presented?

Participant: It should use short paragraphs, clear headings and simple words. Important details such as responsibilities, qualifications, salary, working hours and location should be easy to find.

Wan Jun: Would a plain-language or easy-read mode be useful?

Participant: Yes. An easy-read mode could provide shorter explanations and examples. Helpful icons could also be used, but every icon should have a clear text label.

Jin Ming: What features would make applications easier to complete?

Participant: The application should be divided into small steps and show a progress indicator. Each step should contain clear instructions about what information is required.

Tiong Sheng: Should users be able to save and continue applications?

Participant: Yes. Users should be able to save an incomplete application and return later. The platform should also save progress automatically in case the internet connection is lost.

Wan Jun: How should form errors be explained?

Participant: The platform should clearly identify the problem and explain how to correct it. The error message should use simple language, and the system should not delete information that has already been entered.

Jin Ming: What notification controls should be provided?

Participant: Users should choose how often they receive notifications and whether they receive them through email or the application. They should also be able to turn notifications off or enable a quiet mode.

Tiong Sheng: What interview methods would make you more comfortable?

Participant: Applicants should be able to choose between face-to-face, video, telephone or text-based interviews. They should also be able to request additional preparation time.

Wan Jun: Should disability disclosure be optional?

Participant: Yes. Users should not be forced to state that they have a disability. The system should explain why information is requested and who will be able to see it.

Jin Ming: Should accommodations require a medical diagnosis?

Participant: No. Applicants should only need to describe the support they require. For example, they may request written interview questions or additional preparation time without explaining their diagnosis.

Tiong Sheng: How should job recommendations be determined?

Participant: Recommendations should be based on skills, qualifications, interests, working preferences and location. Disability information should only be considered when the user gives permission.

Wan Jun: Should the platform explain why a job was recommended?

Participant: Yes. It could say that the job matches the user’s skills, preferred working hours or location. This would help users understand and trust the recommendation.

Jin Ming: What access should caregivers or job coaches receive?

Participant: They should only receive access after the user gives consent. The user should decide whether the supporter can view or edit a résumé, complete part of an application or provide advice.

Tiong Sheng: Should supporters be allowed to submit applications?

Participant: Not automatically. The supporter should require the user's approval before submitting anything. Access should also be temporary and removable at any time.

Wan Jun: What should happen when users experience discrimination or scams?

Participant: There should be a simple reporting button. Serious cases should be reviewed by a trained person, because an automated response may not be enough. The platform should also warn other users about confirmed fraudulent postings.

Jin Ming: How should sensitive personal information be protected?

Participant: Privacy settings should be easy to find and understand. Users should control who can access their information, and supporter access should be recorded so users can see what actions were performed.

Wan Jun: To summarise, your needs include plain language, step-by-step forms, draft saving, notification controls, flexible interviews, optional disclosure, explained recommendations and consent-based support access. Is that correct?

Participant: Yes, that is correct.

Interview 3 Questions

Interview ID: INT-03

1. What challenges do employers face when recruiting persons with disabilities?
2. What employer functions should the platform provide?
3. What information should job advertisements contain?
4. What workplace-accessibility information should employers provide?
5. How should accessibility information be maintained?
6. Should disability information be hidden during initial screening?
7. When should accommodation information be shared?
8. Would partially anonymous applications be acceptable?
9. How should candidates be recommended to employers?
10. Should automated systems make final recruitment decisions?
11. How should employers be verified?
12. How should disability-inclusive claims be verified?
13. How should misleading employer information be reported?
14. How should discrimination complaints be handled?
15. What privacy and security controls should the platform provide?

Interview Transcript 3

Wan Jun: Thank you for participating in this interview. We are developing an accessible job-search platform that connects persons with disabilities with inclusive employers. Are you comfortable continuing?

Participant: Yes, I am comfortable continuing.

Jin Ming: What challenges do employers face when recruiting persons with disabilities?

Participant: Some employers want to recruit inclusively but may not understand how to describe accessibility or respond to accommodation requests. Employers may also be uncertain about which disability-related questions are appropriate during recruitment.

Tiong Sheng: What employer functions should the platform provide?

Participant: Employers need a simple job-posting form, application-management tools and ways to communicate with applicants. The platform should also provide guidance on inclusive recruitment and workplace accommodations.

Wan Jun: What information should job advertisements contain?

Participant: Advertisements should include the job responsibilities, required qualifications, salary range, working hours, location and working arrangement. Essential responsibilities should be separated from optional responsibilities.

Jin Ming: What workplace-accessibility information should employers provide?

Participant: Employers should state whether the workplace has ramps, lifts, accessible toilets, accessible parking and nearby public transportation. They should also mention whether remote or hybrid work is available.

Tiong Sheng: How should accessibility information be maintained?

Participant: Employers should be able to update it whenever workplace conditions change. The platform could send reminders asking employers to review the information regularly.

Wan Jun: Should disability information be hidden during initial screening?

Participant: Yes. Employers should first evaluate the applicant's skills, qualifications and experience. Disability information should not influence the initial screening decision.

Jin Ming: When should accommodation information be shared?

Participant: It should only be shared when necessary and when the applicant gives permission. For example, it could be shared when arranging an interview or preparing the workplace.

Tiong Sheng: Would partially anonymous applications be acceptable?

Participant: Yes. The applicant's name, photograph, age and disability information could be hidden during early screening. Skills, qualifications and work experience should remain visible.

Wan Jun: How should candidates be recommended to employers?

Participant: Candidate recommendations should be based on skills, qualifications, experience and work preferences. The system should explain which requirements the candidate matches.

Jin Ming: Should automated systems make final recruitment decisions?

Participant: No. Automated recommendations should support the employer, but final decisions should involve human judgement. Employers should also be able to review and correct unsuitable recommendations.

Tiong Sheng: How should employers be verified?

Participant: The platform should check the organisation's registration details, official email address, contact information and authorised HR representative before allowing it to post jobs.

Wan Jun: How should disability-inclusive claims be verified?

Participant: Employers should complete a structured accessibility assessment and provide evidence of their facilities and accommodation policies. An inclusive-employer badge should only be awarded after the information is reviewed.

Jin Ming: How should misleading employer information be reported?

Participant: Job seekers should be able to report inaccurate accessibility information or misleading inclusion claims. The employer should be asked to correct the information, and repeated false claims should result in further action.

Tiong Sheng: How should discrimination complaints be handled?

Participant: The complaint should be reviewed by trained platform staff. The job seeker should receive support, but the employer should also be informed and allowed to respond through a fair process.

Wan Jun: What privacy and security controls should the platform provide?

Participant: Employers should only access information required for recruitment. Sensitive disability information should be limited to authorised HR personnel, protected from unauthorised access and removed when it is no longer needed.

Wan Jun: To summarise, the main employer requirements are clear job-posting tools, accurate accessibility information, partial anonymity, skills-based matching, employer verification, transparent complaint handling and secure information management. Is that correct?

Participant: Yes, that accurately represents the employer perspective.
